DETAILED ACTION

Applicant's election of Group II in the reply filed on April 22, 2005 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claims 1 to 15 withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on April 22, 2005.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to

Art Unit: 1722

consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 16 to 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Konrad et al (4,107,218).

The Konrad et al reference teaches an apparatus for the production of crystals. The first unit is a reactor to create bisphenol-A in solvent. The outlet stream from the reactor is feed to a separator unit. The separator unit removes phenol from the stream. The outlet stream is then fed to a crystallizer where the crystals are formed and removed from the solvent. The solvent is then recycled to the reactor, note figures and col. 3. The sole difference between the instant claims and the prior art is the specific product. However, in the absence of unexpected results, it would have been obvious to one of ordinary skill in the art to determine through routine experimentation the optimum, operable crystallizer conditions in the Konrad et al reference in order to create a purer product.

Claims 25 to 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Konrad et al (4,107,218).

The Konrad et al reference is relied on for the same reasons as stated, supra, and differs from the instant claims in the separate removal units. However, in the absence of unexpected results, it would have been obvious to one of ordinary skill in the art to determine through routine experimentation the optimum, operable apparatus units to remove just phenol and then another unit to separate in the Konrad et al reference in order to change the stream prior to the crystallizer increasing control over the product.
